# Case Study: Multifamily "Go / No-Go" Underwriting Model

*A rapid, data-backed decision engine for real estate acquisition teams.*

## At a glance

We built a custom Multifamily Go/No-Go Underwriting Model to help investors and acquisition teams make rapid directional decisions in under 40 minutes. Instead of diving straight into complex underwriting files, this tool allows users to input raw T-12 and rent roll data, auto-map expenses, benchmark rents, and evaluate cap rate spreads. By generating clear Green, Yellow, or Red signals, teams can instantly determine if a deal justifies deeper, time-intensive underwriting.

## Key metrics

**< 40 MINUTES:**
Total time to reach a directional Go/No-Go decision.

**3 SCENARIO VIEWS:**
Evaluates Seller T-12, Conservative Downside, and Stabilized Pro Forma.

**AUTOMATED MAPPING:**
Instantly standardizes varied T-12s and rent rolls.

## CHALLENGES

Multifamily acquisition teams often waste hours building full financial models just to decide if a deal is worth pursuing. They struggle with drastically varying raw T-12 and rent roll formats from brokers, unstandardized expense categories that prevent apples-to-apples comparisons, and unrealistic pro forma assumptions. Without a quick way to test pricing and cap rate sensitivities on the fly, decision-making often becomes intuition-based, causing teams to burn valuable time on deals that shouldn't move forward.

## SOLUTIONS

We built an automated workflow that instantly ingests raw data, maps expenses, and summarizes unit types. A built-in framework calculates pro forma rents against market comps, while a 3-scenario dashboard evaluates cap rate spreads to generate a definitive Green, Yellow, or Red investment signal.

**Scenario Dashboard**

**Automated Data Intake**

**Cap Rate Analytics**

## BENEFITS

1

### Accelerated Decision-Making

Reduces initial underwriting time to under 40 minutes, saving hours of work and preventing teams from committing to deep models for dead-end deals.

2

### Standardized & Objective Analysis

Eliminates analyst-to-analyst variation by standardizing inputs and replacing intuition with rules-based, Green/Yellow/Red cap rate spread signals.

3

### Strategic Offer Positioning

Provides instant sensitivity testing for pricing and realistic rent growth assumptions, helping teams determine a data-backed offer range before issuing an LOI.
